

Airkey Wiegand Transmitter & Receiver

Need secure remote access to doors, gates or roller shutters? The Airkey wiegand transmitter and receiver are what you need.

The AKRX22-W26 receiver will transfer all Airkey 2 button transmitters, allowing you to remotely unlock one access control door per button on the keyfob transmitter.

The outputs on the receiver simply connect to the door inputs on the Challenger 4 door controller or single door controller. When a keyfob button is pressed, the receiver will output the 26 bit wiegand signal for from the keyfob to the access control system, providing control over who goes through the door. To the panel, it looks just as though the person has badged their card at the reader.

Contact Bellbond to place an order. When doing so, please specify the site code and card range.

NOTE: We can also add HID proximity to the keyfob so that it remotely opens the garage door and then gains you access at the front door by simply presenting the keyfob at the HID proximity reader.
